## CROSS-REFERENCE TO RELATED APPLICATIONS

This application is related to and claims the benefit of U.S. Application Serial No. 60/327,818, filed October 9, 2001, the disclosure of which is incorporated by reference herein.

## BACKGROUND OF THE INVENTION

The recruitment of immune cells to sites of injury involves the concerted interactions of a large number of soluble mediators. Several cytokines appear to play key roles in these processes, particularly IL-1 and TNF. Both cytokines are derived from mononuclear cells and macrophages, along with other cell types. Physiologically, they produce many of the same proinflammatory responses, including fever, sleep and anorexia, mobilization and activation of polymorphonuclear leukocytes, induction of cyclooxygenase and lipoxxygenase enzymes, increase in adhesion molecule expression, activation of B-cells, T-cells and natural killer cells, and stimulation of production of other cytokines. Other actions include a contribution to the tissue degeneration seen in chronic inflammatory conditions, such as stimulation of fibroblast proliferation, induction of collagenase, *etc.* They have also been implicated in the process of bone resorption and adipose tissue regulation. Thus, these cytokines play key roles in a large number of pathological conditions, including rheumatoid arthritis, inflammatory bowel disease, multiple sclerosis, diabetes, obesity, cancer, sepsis, *etc.*

The importance of IL-1 in inflammation has been demonstrated by the ability of the highly specific IL-1 receptor antagonist protein (IL-1Ra, or IRAP) to relieve inflammatory conditions (for review, *see, e.g.,* Dinarello (1997) *Cytokine Growth Factor Rev.* 8:253-265).

30

IL-1 treatment of cells induces the formation of a complex consisting of the two IL-1 receptor chains, IL-1R1 and IL-1RAcP, and the resulting heterodimer recruits an adaptor molecule designated as MyD88 (Wesche *et al.* (1999) *J. Biol. Chem.*

274:19403-19410). MyD88 binds to a protein designated IRAK (IL-1 receptor associated kinase) (see, O'Neill *et al.* (1998) *J. Leukoc. Biol.* **63**(6):650-657, Auron (1998) *Cytokine Growth Factor Rev.* **9**(3-4):221-237 and O'Neill (2000) *Biochem. Soc. Trans.* **28**(5):557-563, for reviews). IRAK is subsequently phosphorylated and released  
5 from the receptor complex to interact with a tumor necrosis factor receptor-associated factor, TRAF6, which transduces the signal to downstream effector molecules (Cao *et al.* (1996) *Nature* **383**:443-446). TRAF6 can trigger the NIK/IKK kinase cascade to activate the transcription factor NF- $\kappa$ B. NF- $\kappa$ B regulates a number of genes that, in turn, regulate immune and inflammatory responses.

10 Four IRAKs have been identified: IRAK-1 (Cao, *et al.* (1996) *Science* **271**:1128-1131), IRAK-2 (Muzio, *et al.* (1997) *Science* **278**:1612-1615), the monomyeloic cell-specific IRAK-M, also known as IRAK-3 (Wesche, *et al.* (1999) *J. Biol. Chem.* **274**:19403-10) and IRAK-4 (PCT Publication No. WO 01/051641). IRAK proteins have been shown to play a role in transducing signals other than those  
15 originating from IL-1 receptors, including signals triggered by activation of IL-18 receptors (Kanakaraj *et al.* (1999) *J. Exp. Med.* **189**(7):1129-1138) and LPS receptors (Yang *et al.* (1999) *J. Immunol.* **163**:639-643; Wesche *et al.* (1999) *J. Biol. Chem.* **274**:19403-19410). Overexpression of IRAK-2 and IRAK-M has been shown to be  
capable of reconstituting the response to IL-1 and LPS in an IRAK deficient cell line.

20 The identification of compounds that modulate the function of IRAK proteins represents an attractive approach to the development of therapeutic agents for the treatment of inflammatory, cell proliferative and immune-related conditions and diseases associated with IRAK-mediated signal transduction, such as rheumatoid arthritis, inflammatory bowel disease, multiple sclerosis, diabetes, obesity; allergic  
25 disease, psoriasis, asthma, graft rejection, cancer and sepsis.

## DETAILED DESCRIPTION OF THE INVENTION

### Abbreviations and Definitions

30           The abbreviations used herein are conventional, unless otherwise defined.

As used herein, the term "IRAK" refers to an interleukin-1 (IL-1) receptor-associated kinase protein or variant thereof that is capable of mediating a cellular response to IL-1 *in vitro* or *in vivo*. IRAK may be kinase-active or kinase-inactive. Exemplary kinase inactive IRAKs include IRAK-1 and IRAK-4. Exemplary  
5 kinase-inactive IRAKs include IRAK-2 and IRAK-3 (also known as IRAK-M). Kinase-active IRAKs may be capable of transphosphorylation of other proteins or autophosphorylation. In preferred embodiments, IRAK is IRAK-1 and/or IRAK-4.

IRAK variants include proteins substantially homologous to native IRAK, *i.e.*, proteins having one or more naturally or non-naturally occurring amino acid  
10 deletions, insertions or substitutions (*e.g.*, IRAK derivatives, homologs and fragments). The amino acid sequence of an IRAK variant preferably is at least about 80% identical to a native IRAK, more preferably at least about 90% identical, and most preferably at least about 95% identical.

The terms "signal transduction", "signaling" and related terms refer to a  
15 process whereby an extracellular signal (*e.g.*, the concentration of a cytokine, hormone, neurotransmitter, growth factor) is transmitted *via* a cascade of intracellular protein-protein interactions to the cell nucleus and generates one or more cellular responses (*e.g.*, gene transcription, protein secretion, mitosis, apoptosis). The interaction of an  
extracellular signaling molecule (*e.g.*, a cytokine, a hormone, a neurotransmitter, a  
20 growth factor) with one or more transmembrane protein receptors at the cell surface can activate one or more signal transduction pathways. The protein-protein interactions in a signal transduction pathway may be multivalent and include covalent and/or non-covalent protein modification. An intracellular signaling molecule, *i.e.*, a signal transducing protein or a signal transducer, may be involved in one or more signal  
25 transduction pathways. As described herein, protein-protein interactions include direct and indirect interactions.

The terms "treat", "treating" and "treatment" refer to a method of alleviating or abrogating a disease and/or its attendant symptoms.

The terms "prevent", "preventing" and "prevention" refer to a method of  
30 barring a subject from acquiring a disease. As used herein, "prevent", "preventing" and "prevention" also include reducing a subject's risk of acquiring a disease.

As used herein, the phrase "IRAK-responsive condition or disorder" and related phrases and terms refer to a condition or disorder that responds favorably to modulation of IRAK activity. Favorable responses to IRAK modulation include alleviation or abrogation of the disease and/or its attendant symptoms, inhibition of the disease, *i.e.*, arrest or reduction of the development of the disease, or its clinical symptoms, and regression of the disease or its clinical symptoms. An IRAK-responsive condition or disease may be completely or partially responsive to IRAK-modulation. An IRAK-responsive condition or disorder may be associated with inappropriate, *e.g.*, less than or greater than normal, IRAK-activity. Inappropriate IRAK functional activity might arise as the result of IRAK expression in cells which normally do not express IRAK, decreased IRAK expression (leading to, *e.g.*, lipid and metabolic disorders and diseases) or increased IRAK expression. An IRAK-responsive condition or disease may include an IRAK-mediated condition or disease, defined below.

As used herein, the phrase "IRAK-mediated condition or disorder" and related phrases and terms refer to a condition or disorder characterized by inappropriate, *e.g.*, less than or greater than normal, IRAK activity. Inappropriate IRAK functional activity might arise as the result of IRAK expression in cells which normally do not express IRAK, increased IRAK expression or degree of intracellular activation (leading to, *e.g.*, inflammatory and autoimmune disorders and diseases) or decreased IRAK expression. An IRAK-mediated condition or disorder may be completely or partially mediated by inappropriate IRAK functional activity. However, an IRAK-mediated condition or disorder is one in which modulation of IRAK results in some effect on the underlying condition or disorder (*e.g.*, an IRAK inhibitor results in some improvement in patient well-being in at least some patients).

As used herein, the phrase "NF- $\kappa$ B-mediated condition or disorder" and related phrases and terms refer to a condition or disorder characterized by inappropriate, *e.g.*, less than or greater than normal, NF- $\kappa$ B activity. Inappropriate NF- $\kappa$ B functional activity might arise as the result of NF- $\kappa$ B expression in cells which normally do not express NF- $\kappa$ B, increased NF- $\kappa$ B expression or degree of intracellular activation (leading to, *e.g.*, inflammatory and autoimmune disorders and diseases) or decreased NF- $\kappa$ B expression. An NF- $\kappa$ B-mediated condition or disorder may be completely or partially mediated by inappropriate NF- $\kappa$ B functional activity. However,

an NF- $\kappa$ B-mediated condition or disorder is one in which modulation of NF- $\kappa$ B activation results in some effect on the underlying condition or disorder (*e.g.*, an inhibitor of NF- $\kappa$ B activation results in some improvement in patient well-being in at least some patients).

5                   The term "therapeutically effective amount" means the amount of the subject compound that will elicit the biological or medical response of a tissue, system, animal or human that is being sought by the researcher, veterinarian, medical doctor or other clinician.

10                   The term "modulate" refers to the ability of a compound to increase or decrease the function and/or expression of IRAK, where IRAK function may include kinase activity and/or protein-binding. Modulation may occur *in vitro* or *in vivo*. Modulation, as described herein, includes the inhibition or activation of IRAK function and/or the downregulation or upregulation of IRAK expression, either directly or indirectly. A modulator preferably activates IRAK function and/or upregulates IRAK  
15                   expression. More preferably, a modulator activates or inhibits IRAK function and/or upregulates or downregulates IRAK expression. Most preferably, a modulator inhibits IRAK function and/or downregulates IRAK expression. The ability of a compound to inhibit IRAK function can be demonstrated in an enzymatic assay or a cell-based assay (*e.g.*, inhibition of IL-1-stimulated NF- $\kappa$ B activation).

20                   The "subject" is defined herein to include animals such as mammals, including, but not limited to, primates (*e.g.*, humans), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice and the like. In preferred embodiments, the subject is a human.

                  The term "alkyl," by itself or as part of another substituent, means, unless otherwise stated, a straight or branched chain, or cyclic hydrocarbon radical, or  
25                   combination thereof, which may be fully saturated, mono- or polyunsaturated and can include di- and multivalent radicals, having the number of carbon atoms designated (*i.e.* C<sub>1</sub>-C<sub>8</sub> means one to eight carbons). Examples of saturated hydrocarbon radicals include groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, sec-butyl, cyclohexyl, (cyclohexyl)methyl, cyclopropylmethyl, homologs and isomers of,  
30                   for example, n-pentyl, n-hexyl, n-heptyl, n-octyl, and the like. An unsaturated alkyl group is one having one or more double bonds or triple bonds. Examples of unsaturated alkyl groups include vinyl, 2-propenyl, crotyl, 2-isopentenyl, 2-

(butadienyl), 2,4-pentadienyl, 3-(1,4-pentadienyl), ethynyl, 1- and 3-propynyl, 3-butynyl, and the higher homologs and isomers.

The term "alkylene" by itself or as part of another substituent means a divalent radical derived from an alkane, as exemplified by  $-\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2-$ , and  
5 further includes those groups described below as "heteroalkylene." Typically, an alkyl (or alkylene) group will have from 1 to 24 carbon atoms, with those groups having 10 or fewer carbon atoms being preferred in the present invention. A "lower alkyl" or "lower alkylene" is a shorter chain alkyl or alkylene group, generally having eight or fewer carbon atoms.

10 The terms "alkoxy," "alkylamino" and "alkylthio" (or thioalkoxy) are used in their conventional sense, and refer to those alkyl groups attached to the remainder of the molecule *via* an oxygen atom, an amino group, or a sulfur atom, respectively. Similarly, the term dialkylamino refers to an amino group having two attached alkyl groups that can be the same or different.

15 The term "heteroalkyl," by itself or in combination with another term, means, unless otherwise stated, a stable straight or branched chain, or cyclic hydrocarbon radical, or combinations thereof, consisting of the stated number of carbon atoms and from one to three heteroatoms selected from O, N, Si and S, and wherein the nitrogen and sulfur atoms may optionally be oxidized and the nitrogen heteroatom may  
20 optionally be quaternized. The heteroatom(s) O, N and S may be placed at any interior position of the heteroalkyl group. The heteroatom Si may be placed at any position of the heteroalkyl group, including the position at which the alkyl group is attached to the remainder of the molecule. Examples include  $-\text{CH}_2-\text{CH}_2-\text{O}-\text{CH}_3$ ,  $-\text{CH}_2-\text{CH}_2-\text{NH}-\text{CH}_3$ ,  $-\text{CH}_2-\text{CH}_2-\text{N}(\text{CH}_3)-\text{CH}_3$ ,  $-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_3$ ,  $-\text{CH}_2-\text{CH}_2-\text{S}(\text{O})-\text{CH}_3$ ,  $-\text{CH}_2-\text{CH}_2-\text{S}(\text{O})_2-\text{CH}_3$ ,  $-\text{CH}=\text{CH}-\text{O}-\text{CH}_3$ ,  $-\text{Si}(\text{CH}_3)_3$ ,  $-\text{CH}_2-\text{CH}=\text{N}-\text{OCH}_3$ , and  $-\text{CH}=\text{CH}-\text{N}(\text{CH}_3)-\text{CH}_3$ . Up  
25 to two heteroatoms may be consecutive, such as, for example,  $-\text{CH}_2-\text{NH}-\text{OCH}_3$  and  $-\text{CH}_2-\text{O}-\text{Si}(\text{CH}_3)_3$ . When a prefix such as (C<sub>2</sub>-C<sub>8</sub>) is used to refer to a heteroalkyl group, the number of carbons (2-8, in this example) is meant to include the heteroatoms as well. For example, a C<sub>2</sub>-heteroalkyl group is meant to include, for example,  $-\text{CH}_2\text{OH}$   
30 (one carbon atom and one heteroatom replacing a carbon atom) and  $-\text{CH}_2\text{SH}$ . The term "heteroalkylene" by itself or as part of another substituent means a divalent radical derived from heteroalkyl, as exemplified by  $-\text{CH}_2-\text{CH}_2-\text{S}-\text{CH}_2\text{CH}_2-$  and  $-\text{CH}_2-\text{S}-\text{CH}_2-$

CH<sub>2</sub>-NH-CH<sub>2</sub>-. For heteroalkylene groups, heteroatoms can also occupy either or both of the chain termini (*e.g.*, alkyleneoxy, alkyleneedioxy, alkyleneamino, alkylenediamino, and the like). Still further, for alkylene and heteroalkylene linking groups, no orientation of the linking group is implied.

5                   The terms "cycloalkyl" and "heterocycloalkyl", by themselves or in combination with other terms, represent, unless otherwise stated, cyclic versions of "alkyl" and "heteroalkyl", respectively. Thus, the terms "cycloalkyl" and "heterocycloalkyl" are meant to be included in the terms "alkyl" and "heteroalkyl", respectively. Additionally, for heterocycloalkyl, a heteroatom can occupy the position  
10                   at which the heterocycle is attached to the remainder of the molecule. Examples of cycloalkyl include cyclopentyl, cyclohexyl, 1-cyclohexenyl, 3-cyclohexenyl, cycloheptyl, and the like. Examples of heterocycloalkyl include 1-(1,2,5,6-tetrahydropyridyl), 1-piperidiny, 2-piperidiny, 3-piperidiny, 4-morpholinyl, 3-morpholinyl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, tetrahydrothien-2-yl,  
15                   tetrahydrothien-3-yl, 1-piperazinyl, 2-piperazinyl, and the like.

                  As used herein, the terms "cyclo(C<sub>3</sub>-C<sub>8</sub>)alkyl" and "(C<sub>3</sub>-C<sub>8</sub>)cycloalkyl" refer to a cyclic hydrocarbon radical having three to eight carbon atoms. When a prefix  
such as (C<sub>3</sub>-C<sub>8</sub>) is used to refer to a heterocycloalkyl group, *e.g.*, "heterocyclo(C<sub>3</sub>-  
C<sub>8</sub>)alkyl" or "hetero(C<sub>3</sub>-C<sub>8</sub>)cycloalkyl", the number of carbons (three to eight, in this  
20                   example) is meant to include the heteroatoms as well.

                  The terms "halo" or "halogen," by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine atom. Additionally, terms such as "haloalkyl", are meant to include alkyl substituted with halogen atoms which can be the same or different, in a number ranging from one  
25                   to (2m'+1), where m' is the total number of carbon atoms in the alkyl group. For example, the term "halo(C<sub>1</sub>-C<sub>4</sub>)alkyl" is meant to include trifluoromethyl, 2,2,2-trifluoroethyl, 4-chlorobutyl, 3-bromopropyl, and the like. Thus, the term "haloalkyl" includes monohaloalkyl (alkyl substituted with one halogen atom) and polyhaloalkyl (alkyl substituted with halogen atoms in a number ranging from two to (2m'+1)  
30                   halogen atoms, where m' is the total number of carbon atoms in the alkyl group). The term "perhaloalkyl" means, unless otherwise stated, alkyl substituted with (2m'+1) halogen atoms, where m' is the total number of carbon atoms in the alkyl group. For

example, the term "perhalo(C<sub>1</sub>-C<sub>4</sub>)alkyl", is meant to include trifluoromethyl, pentachloroethyl, 1,1,1-trifluoro-2-bromo-2-chloroethyl, and the like.

The term "aryl" means, unless otherwise stated, a polyunsaturated, typically aromatic, hydrocarbon substituent which can be a single ring or multiple rings (up to three rings) which are fused together or linked covalently. The term "heteroaryl" refers to aryl groups (or rings) that contain from one to four heteroatoms selected from N, O and S, wherein the nitrogen and sulfur atoms are optionally oxidized, and the nitrogen atom(s) are optionally quaternized. A heteroaryl group can be attached to the remainder of the molecule through a heteroatom. Non-limiting examples of aryl and heteroaryl groups include phenyl, 1-naphthyl, 2-naphthyl, 4-biphenyl, 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 2-phenyl-4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 5-benzothiazolyl, purinyl, 2-benzimidazolyl, 5-indolyl, 1-isoquinolyl, 5-isoquinolyl, 2-quinoxalyl, 5-quinoxalyl, 2-quinolyl, 3-quinolyl, 4-quinolyl, 5-quinolyl, 6-quinolyl, 7-quinolyl and 8-quinolyl. Substituents for each of the above noted aryl and heteroaryl ring systems are selected from the group of acceptable substituents described below.

For brevity, the term "aryl" when used in combination with other terms (e.g., aryloxy, arylthioxy, arylalkyl) includes both aryl and heteroaryl rings as defined above. Thus, the term "arylalkyl" is meant to include those radicals in which an aryl group is attached to an alkyl group (e.g., benzyl, phenethyl, pyridylmethyl and the like), including those alkyl groups in which the alkyl group is a heteroalkyl group.

Each of the above terms (e.g., "alkyl," "heteroalkyl," "aryl" and "heteroaryl") is meant to include both substituted and unsubstituted forms of the indicated radical, unless otherwise indicated. Preferred substituents for each type of radical are provided below.

Substituents for the alkyl and heteroalkyl radicals (including those groups often referred to as alkylene, alkenyl, heteroalkylene, heteroalkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl, and heterocycloalkenyl) can be a variety of groups selected from: -OR', =O, =NR', =N-OR', -NR'R'', -SR', -halogen, -SiR'R''R''', -OC(O)R', -C(O)R', -CO<sub>2</sub>R', -CONR'R'', -OC(O)NR'R'', -NR'C(O)R', -NR'-

$C(O)NR''R'''$ ,  $-NR''C(O)_2R'$ ,  $-NH-C(NH_2)=NH$ ,  $-NR'C(NH_2)=NH$ ,  $-NH-C(NH_2)=NR'$ ,  
 $-S(O)R'$ ,  $-S(O)_2R'$ ,  $-S(O)_2NR'R''$ ,  $-CN$  and  $-NO_2$  in a number ranging from zero to  
 $(2m'+1)$ , where  $m'$  is the total number of carbon atoms in such radical.  $R'$ ,  $R''$  and  $R'''$   
each independently refer to hydrogen, unsubstituted  $(C_1-C_8)$ alkyl and heteroalkyl,  
5 unsubstituted aryl, aryl substituted with 1-3 halogens, alkoxy or thioalkoxy groups, or  
aryl- $(C_1-C_4)$ alkyl groups. When  $R'$  and  $R''$  are attached to the same nitrogen atom, they  
can be combined with the nitrogen atom to form a 5-, 6-, or 7-membered ring. For  
example,  $-NR'R''$  is meant to include 1-pyrrolidinyl and 4-morpholinyl. From the  
above discussion of substituents, one of skill in the art will understand that the term  
10 "alkyl" in its broadest sense is meant to include groups such as haloalkyl (e.g.,  $-CF_3$  and  
 $-CH_2CF_3$ ) and acyl (e.g.,  $-C(O)CH_3$ ,  $-C(O)CF_3$ ,  $-C(O)CH_2OCH_3$ , and the like).  
Preferably, the alkyl groups will have from 0-3 substituents, more preferably 0, 1, or 2  
substituents, unless otherwise specified.

Similarly, substituents for the aryl and heteroaryl groups are varied and  
15 are selected from:  $-halogen$ ,  $-OR'$ ,  $-OC(O)R'$ ,  $-NR'R''$ ,  $-SR'$ ,  $-R'$ ,  $-CN$ ,  $-NO_2$ ,  $-CO_2R'$ ,  
 $-CONR'R''$ ,  $-C(O)R'$ ,  $-OC(O)NR'R''$ ,  $-NR''C(O)R'$ ,  $-NR''C(O)_2R'$ ,  $-NR'-C(O)NR''R'''$ ,  
 $-NH-C(NH_2)=NH$ ,  $-NR'C(NH_2)=NH$ ,  $-NH-C(NH_2)=NR'$ ,  $-S(O)R'$ ,  $-S(O)_2R'$ ,  
 $-S(O)_2NR'R''$ ,  $-N_3$ ,  $-CH(Ph)_2$ , perfluoro $(C_1-C_4)$ alkoxy, and perfluoro $(C_1-C_4)$ alkyl, in a  
number ranging from zero to the total number of open valences on the aromatic ring  
20 system; and where  $R'$ ,  $R''$  and  $R'''$  are independently selected from hydrogen,  
 $(C_1-C_8)$ alkyl and heteroalkyl, unsubstituted aryl and heteroaryl, (unsubstituted aryl)-  
 $(C_1-C_4)$ alkyl, and (unsubstituted aryl)oxy- $(C_1-C_4)$ alkyl.

Two of the substituents on adjacent atoms of the aryl or heteroaryl ring  
may optionally be replaced with a substituent of the formula  $-T-C(O)-(CH_2)_q-U-$ ,  
25 wherein T and U are independently  $-NH-$ ,  $-O-$ ,  $-CH_2-$  or a single bond, and the subscript  
q is an integer of from 0 to 2. Alternatively, two of the substituents on adjacent atoms  
of the aryl or heteroaryl ring may optionally be replaced with a substituent of the  
formula  $-A-(CH_2)_r-B-$ , wherein A and B are independently  $-CH_2-$ ,  $-O-$ ,  $-NH-$ ,  $-S-$ ,  $-$   
 $S(O)-$ ,  $-S(O)_2-$ ,  $-S(O)_2NR'-$  or a single bond, and the subscript r is an integer of from 1  
30 to 3. One of the single bonds of the new ring so formed may optionally be replaced  
with a double bond. Alternatively, two of the substituents on adjacent atoms of the aryl  
or heteroaryl ring may optionally be replaced with a substituent of the formula  $-(CH_2)_s-$

$X-(CH_2)_t-$ , where the subscripts  $s$  and  $t$  are independently integers of from 0 to 3, and  $X$  is  $-O-$ ,  $-NR'-$ ,  $-S-$ ,  $-S(O)-$ ,  $-S(O)_2-$ , or  $-S(O)_2NR'-$ . The substituent  $R'$  in  $-NR'-$  and  $-S(O)_2NR'-$  is hydrogen or unsubstituted  $(C_1-C_6)$ alkyl.

As used herein, the term "heteroatom" is meant to include oxygen (O),  
5 nitrogen (N), sulfur (S) and silicon (Si).

The term "pharmaceutically acceptable salts" is meant to include salts of the active compounds which are prepared with relatively nontoxic acids or bases, depending on the particular substituents found on the compounds described herein.

When compounds of the present invention contain relatively acidic functionalities, base  
10 addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired base, either neat or in a suitable inert solvent.

Examples of pharmaceutically acceptable base addition salts include sodium, potassium, calcium, ammonium, organic amino, or magnesium salt, or a similar salt.

When compounds of the present invention contain relatively basic functionalities, acid  
15 addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired acid, either neat or in a suitable inert solvent.

Examples of pharmaceutically acceptable acid addition salts include those derived from inorganic acids like hydrochloric, hydrobromic, nitric, carbonic, monohydrogenphosphoric, phosphoric, monohydrogenphosphoric, dihydrogenphosphoric,  
20 sulfuric, monohydrogensulfuric, hydriodic, or phosphorous acids and the like, as well as the salts derived from relatively nontoxic organic acids like acetic, propionic, isobutyric, maleic, malonic, benzoic, succinic, suberic, fumaric, mandelic, phthalic, benzenesulfonic, p-tolylsulfonic, citric, tartaric, methanesulfonic, and the like. Also included are salts of amino acids such as arginate and the like, and salts of organic  
25 acids like glucuronic or galacturonic acids and the like (see, for example, Berge *et al.* (1977) *J. Pharm. Sci.* 66:1-19). Certain specific compounds of the present invention contain both basic and acidic functionalities that allow the compounds to be converted into either base or acid addition salts.

The neutral forms of the compounds may be regenerated by contacting  
30 the salt with a base or acid and isolating the parent compound in the conventional manner. The parent form of the compound differs from the various salt forms in certain physical properties, such as solubility in polar solvents, but otherwise the salts are

equivalent to the parent form of the compound for the purposes of the present invention.

In addition to salt forms, the present invention provides compounds which are in a prodrug form. Prodrugs of the compounds described herein are those compounds that readily undergo chemical changes under physiological conditions to provide the compounds of the present invention. Additionally, prodrugs can be converted to the compounds of the present invention by chemical or biochemical methods in an *ex vivo* environment. For example, prodrugs can be slowly converted to the compounds of the present invention when placed in a transdermal patch reservoir with a suitable enzyme or chemical reagent. Prodrugs are often useful because, in some situations, they may be easier to administer than the parent drug. They may, for instance, be bioavailable by oral administration whereas the parent drug is not. The prodrug may also have improved solubility in pharmaceutical compositions over the parent drug. A wide variety of prodrug derivatives are known in the art, such as those that rely on hydrolytic cleavage or oxidative activation of the prodrug. An example, without limitation, of a prodrug would be a compound of the present invention which is administered as an ester (the "prodrug"), but then is metabolically hydrolyzed to the carboxylic acid, the active entity. Additional examples include peptidyl derivatives of a compound of the invention.

Certain compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms are equivalent to unsolvated forms and are intended to be encompassed within the scope of the present invention. Certain compounds of the present invention may exist in multiple crystalline or amorphous forms. In general, all physical forms are equivalent for the uses contemplated by the present invention and are intended to be within the scope of the present invention.

Certain compounds of the present invention possess asymmetric carbon atoms (optical centers) or double bonds; the racemates, diastereomers, geometric isomers and individual isomers are all intended to be encompassed within the scope of the present invention.

The compounds of the present invention may also contain unnatural proportions of atomic isotopes at one or more of the atoms that constitute such

compounds. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium ( $^3\text{H}$ ), iodine-125 ( $^{125}\text{I}$ ) or carbon-14 ( $^{14}\text{C}$ ). All isotopic variations of the compounds of the present invention, whether radioactive or not, are intended to be encompassed within the scope of the present invention.

## Description of the Embodiments

The present invention is directed to compounds, compositions and methods useful in the modulation of IRAK. Accordingly, the compounds of the present invention are compounds which inhibit at least one function or characteristic of a mammalian IRAK polypeptide, for example, a human IRAK polypeptide.

The full-length human IRAK-1 protein (GenBank Accession No. L76191) has been described, see, *e.g.*, Cao *et al.* (1996) *Science* 271(5252):1128-1131, IRAK-1 is an active protein kinase and is capable of autophosphorylation *in vitro*. However, it has been shown that the enzymatic activity is not required for an IRAK-mediated cellular response to IL-1, *e.g.*, IL-1-stimulated NF- $\kappa$ B activation. IRAK-4 (GenBank Accession No. AX196260) is described in PCT Publication No. WO 01/051641.

## IRAK Modulators

The present invention provides compounds having antiinflammatory and anti-immunoregulatory activity. It is believed that the compounds of the invention will interfere with inappropriate IL-1 induced signal transduction by specifically modulating or inhibiting IRAK function, *e.g.*, IRAK-1 and/or IRAK-4 function. IRAK is an intracellular component of the signaling pathway that is activated by the binding of IL-1 to the IL-1 receptor (IL-1R). In particular, IRAK associates with the active receptor complex and transduces the IL-1 signal by interacting with one or more intracellular signaling molecules. Cellular responses to IRAK-mediated signal transduction include increased transcription of genes that regulate inflammatory and immune responses, *e.g.*, NF- $\kappa$ B. Therefore, inhibition of IRAK function, *e.g.*, inhibition of IRAK kinase

activity, will inhibit an IRAK-mediated cellular response and treat or prevent an IRAK-mediated condition or disorder.

While a precise understanding of the mechanism by which compounds of the present invention inhibit an IRAK-mediated response is not required in order to practice the present invention, it is believed that the compounds interfere with the phosphorylation by IRAK of one or more intracellular proteins, including IRAK itself. Compounds contemplated by the invention include, but are not limited to, the exemplary compounds provided herein.

### Synthesis of IRAK Modulators

Synthesis routes to the compounds provided herein are described in the Examples. One of skill in the art will appreciate that the substituents (*e.g.*, R', R'', R''', *etc.*) can be altered before, during or after preparation of the heterocyclic scaffolding and that suitable adjustments in the exemplary conditions (*e.g.*, temperatures, solvents, *etc.*) can be made. Additionally, one of skill in the art will recognize that protecting groups may be necessary for the preparation of certain compounds and will be aware of those conditions compatible with a selected protecting group.

### Compositions

In another aspect, the present invention provides pharmaceutical compositions for modulating IRAK. The compositions comprise a compound of the present invention with a pharmaceutically acceptable carrier or excipient.

The term "composition" as used herein is intended to encompass a product comprising the specified ingredients (and in the specified amounts, if indicated), as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts. By "pharmaceutically acceptable" it is meant that the carrier or excipient is compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

In one embodiment, the invention provides the subject compounds combined with a pharmaceutically acceptable excipient such as sterile saline, methylcellulose solutions, detergent solutions or other medium, water, gelatin, oils, *etc.* The compounds or compositions may be administered alone or in combination with any convenient carrier, diluent, *etc.*, and such administration may be provided in single or multiple dosages. Useful carriers include water soluble and water insoluble solids, fatty

acids, micelles, inverse micelles, liposomes and semi-solid or liquid media, including aqueous solutions and non-toxic organic solvents. All of the above formulations may be treated with ultrasounds, stirred, mixed, high-shear mixed, heated, ground, milled, aerosolized, pulverized, lyophilized, *etc.* to form pharmaceutically acceptable compositions.

The pharmaceutical compositions for the administration of the compounds of this invention may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the pharmaceutical compositions are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation. In the pharmaceutical composition the active object compound is included in an amount sufficient to produce the desired effect upon the process or condition of diseases.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions. Such compositions may contain one or more agents selected from sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with other non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or

glyceryl distearate may be employed. They may also be coated by the techniques described in U.S. Patent Nos. 4,256,108; 4,166,452 and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules  
5 wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active materials in admixture with  
10 excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with  
15 fatty acids, for example polyoxy-ethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol  
monooleate, or condensation products of ethylene oxide with partial esters derived from  
20 fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Oily suspensions may be formulated by suspending the active ingredient  
25 in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant  
30 such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a

dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

5           The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin,  
10 and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

          Syrups and elixirs may be formulated with sweetening agents, for  
15 example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

          The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and  
20 suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are  
25 conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

          The compounds of the present invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be  
30 prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the

rectum to release the drug. Such materials include cocoa butter and polyethylene glycols.

For topical use, creams, ointments, jellies, solutions or suspensions, *etc.*, containing the compounds of the present invention are employed. As used herein, topical application is also meant to include the use of mouthwashes and gargles.

The pharmaceutical compositions and methods of the present invention may further comprise other therapeutically active compounds as noted herein which are usually applied in the treatment or prevention of the above mentioned pathological conditions.

### EXAMPLES

25

Reagents and solvents used below can be obtained from commercial sources such as Aldrich Chemical Co. (Milwaukee, Wisconsin, USA).  $^1\text{H}$ -NMR spectra were recorded on a Bruker 400 MHz NMR spectrometer. Significant peaks are tabulated in the order: multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br s, broad singlet), coupling constant(s) in Hertz (Hz), number of protons. Electron Ionization (EI) mass spectra were recorded on a Hewlett Packard 5989A mass spectrometer. Mass spectrometry results are reported as the ratio of mass over charge, followed by the relative abundance of each ion (in parentheses). In tables, a single  $m/e$  value is reported for the  $M+H$  (or, as noted,  $M-H$ ) ion containing the most common atomic isotopes. Isotope patterns correspond to the expected formula in all cases. Electrospray ionization (ESI) mass spectrometry analysis was conducted on a Hewlett-

30

Packard 1100 MSD electrospray mass spectrometer using the HP1 100 HPLC for sample delivery. Normally the analyte was dissolved in methanol at 0.1 mg/mL and 1 microliter ( $\mu\text{L}$ ) was infused with the delivery solvent into the mass spectrometer, which scanned from 100 to 1500 daltons. All compounds could be analyzed in the positive  
5 ESI mode, using 1:1 acetonitrile/water with 1% acetic acid as the delivery solvent. The compounds provided below could also be analyzed in the negative ESI mode, using 2mM  $\text{NH}_4\text{OAc}$  in acetonitrile/water as delivery solvent.

**Synthesis of 3-carboxymethyl-N-(1-(2-morpholin-4-yl-ethyl)-1H-benzoimidazol-2-yl)-benzamide (11).**

5 (a) 2-(4-(2-Aminoethyl)morpholine)nitrobenzene: To a 25 mL flask containing 2.0 mL 2-fluoronitrobenzene (19.0 mmol, 1.0 equiv) was carefully added 2.48 mL 4-(2-aminoethyl)morpholine (19.0 mmol, 1.0 equiv) over a period of 15 min (*caution, exothermic reaction*). The reaction was allowed to stir for 12 h at which time it was diluted with sat. NaHCO<sub>3</sub>. The solution was then extracted (3 x CH<sub>2</sub>Cl<sub>2</sub>), dried

10 (Na<sub>2</sub>SO<sub>4</sub>), and concentrated under reduced pressure. Purification by flash chromatography (SiO<sub>2</sub>, 0-5% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) gave the product 2-(4-(2-aminoethyl)morpholine)nitrobenzene as a yellow oil 3.69 g (14.7 mmol).

(b) 2-(4-(2-Aminoethyl)morpholine)aniline: A 200 mL flask was charged with 1.0 g of palladium on carbon (5 wt%), and 5 mL EtOH under N<sub>2</sub>. 3.7 g 2-(4-(2-Aminoethyl)morpholine)nitrobenzene (14.7 mmol, 1.0 equiv) was dissolved in 20 mL EtOH, and the solution was added to the catalyst suspension, followed by the addition of 7 mL cyclohexene. The flask was equipped with a reflux condenser, and heated to 83 °C. After stirring for 1 h, the suspension was removed from the heating bath and allowed to cool to rt. The suspension was then filtered through a pad of celite

15 to remove the catalyst, and the celite pad was washed 6 x EtOH. The combined

20 organics were concentrated under reduced pressure to give the product 2-(4-(2-

aminoethyl)morpholine)aniline as a black viscous oil which was sufficiently pure to continue to the next step (3.96 g, quant.).

(c) 1-(2-Morpholin-4-yl-ethyl)-2-aminobenzimidazole: A 250 mL flask was charged with 40 mL H<sub>2</sub>O followed by the addition of 3.94 mL of a 5.0 M solution of cyanogen bromide in CH<sub>3</sub>CN (19.7 mmol, 1.1 equiv). The 2-(4-(2-aminoethyl)morpholine)aniline prepared above (3.96 g, ~17.92 mmol, 1.0 equiv) was dissolved in 40 mL MeOH, and was introduced via addition funnel over a period of 1 h to the cyanogen bromide solution. After stirring for 24 h the solution was concentrated under reduced pressure to remove MeOH, and the resulting acidic aqueous solution was washed 2 x EtOAc. The EtOAc fractions were back extracted 1 x H<sub>2</sub>O, and the combined aqueous solutions were neutralized with sat. NaHCO<sub>3</sub>. **Synthesis of 3-nitro-*N*-(1-hydroxypropyl-5-(2',2'-dimethylpropionyl)-1*H*-benzoimidazol-2-yl)-benzamide (15a) and 3-Nitro-*N*-(1-hydroxypropyl-6-(2',2'-dimethylpropionyl)-1*H*-benzoimidazol-2-yl)-benzamide (15b).** This example illustrates the synthesis of 3-nitro-*N*-(1-hydroxypropyl-5-(2',2'-dimethylpropionyl)-1*H*-benzoimidazol-2-yl)-benzamide and 3-Nitro-*N*-(1-hydroxypropyl-6-(2',2'-dimethylpropionyl)-1*H*-benzoimidazol-2-yl)-benzamide as a mixture of the two isomers:

(a) 4-(2',2'-Dimethylpropionyl)-1,2-dinitrobenzene: A 1L flask was charged with 10 g (54.3 mmol, 1.0 equiv) 3,4-dinitrophenol and 300 mL CH<sub>2</sub>Cl<sub>2</sub>. The resulting solution was cooled in an ice bath to 0 °C followed by the addition of 9.84 mL triethylamine (70.6 mmol, 1.3 equiv) and 7.35 mL pivoyl chloride (59.7 mmol, 1.1 equiv). After stirring for 15 min the solution was diluted with sat. NaHCO<sub>3</sub> and extracted (2 x CH<sub>2</sub>Cl<sub>2</sub>). The CH<sub>2</sub>Cl<sub>2</sub> solution was then dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated under reduced pressure to give the 4-(2',2'-dimethylpropionyl)-1,2-dinitrobenzene product as a light golden oil which was used directly in the next step.

(b) 4-(2',2'-dimethylpropionyl)-1,2-aminobenzene: A 250 mL flask which had been purged under nitrogen was charged with 2 g 5% wt palladium on carbon and 20 mL EtOH. The starting material (4-(2',2'-dimethylpropionyl)-1,2-dinitrobenzene produced in step (a) above, ~54 mmol) was dissolved in 140 mL EtOH and added to the flask, followed by the addition of 46 mL cyclohexene. The flask was then equipped with a reflux condenser and heated to 80 °C. After heating for 24 h the hot suspension was filtered through celite, and the celite pad was washed (4 x EtOH). The combined EtOH solutions were concentrated under reduced pressure to give 10.71 g of the product 4-(2',2'-dimethylpropionyl)-1,2-aminobenzene which was taken on to the next step without further purification (51.4 mmol).

(c) 2-Amino-5-(2',2'-dimethylpropionyl)benzimidazole: To a flask containing 60 mL H<sub>2</sub>O was added 11.32 mL of a 5.0 M solution of cyanogen bromide in CH<sub>3</sub>CN followed by the addition of 10.71 g 4-(2',2'-dimethylpropionyl)-1,2-aminobenzene (51.5 mmol, prepared above in step (b), 1.0 equiv) in 60 mL EtOH over 30 min via addition funnel. After stirring for 20 h the solution was concentrated under reduced pressure to remove the EtOH. The resulting aqueous solution was washed (2 x EtOAc), and the EtOAc fractions were back extracted 2 x H<sub>2</sub>O. The combined aqueous

layers were made basic with sat.  $\text{NaHCO}_3$ , and then extracted (3 x EtOAc). The organic layer was then washed (1 x brine), dried ( $\text{MgSO}_4$ ), and concentrated under reduced pressure to give the product benzimidazole as a brown solid (8.59 g, 36.8 mmol):  $^1\text{H}$  NMR ( $\text{DMSO-d}_6$ , 400 MHz)  $\delta$  7.04 (d,  $J$  = 8.3 Hz, 1 H), 6.79 (d,  $J$  = 2.2 Hz, 1 H), 6.53 (dd,  $J$  = 2.2, 8.3 Hz, 1 H), 6.31 (broad s, 2 H), 1.28 (s, 9 H).

The resulting slurry was allowed to stir for 20 h, and was then diluted with a 10% citric acid solution and extracted (3 x EtOAc). The organics were washed (1 x 10% citric acid, 2 x sat.  $\text{NaHCO}_3$ , 1 x brine), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated under reduced pressure. The resulting solid was triturated from MeOH, filtered, washed (3 x MeOH), and dried under reduced pressure to give the product as a tan solid (4.87 g, 12.7 mmol):  $^1\text{H}$  NMR ( $\text{DMSO-d}_6$ , 400 MHz)  $\delta$  12.60 (broad s, 2 H), 8.96 (t,  $J$  = 1.9 Hz, 1 H), 8.55 (d,  $J$  = 7.8 Hz, 1 H), 8.41 (dd,  $J$  = 1.5, 8.2 Hz, 1 H), 7.81 (t,  $J$  = 7.9 Hz, 1 H), 7.45 (d,  $J$  = 8.6 Hz, 1 H), 7.16 (d,  $J$  = 2.2 Hz, 1 H), 6.91 (dd,  $J$  = 2.2, 8.5 Hz, 1 H), 1.30 (s, 9 H).

The suspension was heated to 55 °C for 25 min, and then poured into a solution of sat.  $\text{NaHCO}_3$ . The acetone was removed under reduced pressure, and the aqueous solution was then extracted (4 x  $\text{CH}_2\text{Cl}_2$ ), washed (2 x  $\text{H}_2\text{O}$ ), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated under reduced pressure. The reaction mixture was then cooled, and ethyl acetate (400 mL) was added. The solution was then extracted with water (2 x 100 mL), dried over magnesium sulphate and evaporated to afford 4-cyclohexylamino-3-nitrobenzyl alcohol as an orange oil.

(b) To a solution of 4-cyclohexylamino-3-nitrobenzyl alcohol (21.0 g, 83 mmol) in DCM (300 mL) was added powdered 4Å molecular sieves (15 g) and N-methyl morpholine-N-oxide monohydrate (10.8 g, 92.2 mmol). Tetra-n-

propylammonium perruthenate (VII) (2.91 g, 8.28 mmol) was then added in a single portion. An initial exotherm was controlled using an ice bath, and then the reaction mixture was stirred at room temperature for 18 hr. The mixture was then reduced to ~100 mL by evaporation, and loaded onto a column of silica (400 g). The column was  
5 eluted with acetone:hexane 1:3 and the spot at 0.30 was collected, affording 4-cyclohexylamino-3-nitrobenzaldehyde as a yellow solid. (11.0 g, 44.3 mmol):  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 300 MHz)  $\delta$  9.60 (s, 1 H), 8.32 (s, 1 H), 7.71 (d,  $J = 10$  Hz, 1 H), 6.73 (d,  $J = 10$  Hz, 1 H) 3.46-3.32 (m, 1 H), 1.90-1.15 (m, 10 H).

(c) To a solution of 4-cyclohexylamino-3-nitrobenzaldehyde (10.3  
10 g, 41.3 mmol) in dichloroethane (50 mL) was added piperidine (4.10 g, 48.2 mmol) followed by acetic acid (0.20 mL, cat.). The reaction mixture was heated to 60°C and stirred for 1 hr, then cooled to room temperature and sodium triacetoxyborohydride (10.5 g, 49.5 mmol) was added in a single portion. After stirring for 18 hr at room temperature, the reaction was quenched by the addition of  
15 sodium bicarbonate (sat., aq., 100 mL), and the mixture was extracted with ethyl acetate (3 x 100 mL). The combined organic extracts were then evaporated to afford crude N-cyclohexyl-2-nitro-4-(1-piperidinylmethyl) aniline as a yellow oil (15.4 g crude yield).

The Mixture was then cooled to room temperature, and sodium hydroxide (2N, aq.) was added until the pH was 13. Brine (100 mL) was then added and the mixture was extracted with ethyl acetate (3 x 250 mL). The combined extracts

The reaction mixture was then stirred at room temperature for 18 hr, and reduced to ~30 mL by evaporation. Ethyl acetate (50 mL) was then added, and the mixture extracted with hydrochloric acid (1 N, aq., 2 x 50 mL).

## Example 36

**Enzymatic inhibition assay.** This example provides a method that is useful for evaluating test compounds for inhibition of IRAK-1 or IRAK-4 kinase activity.

20

Protocol

25

96-well polystyrene microtiter plates were coated with neutravidin for IRAK-1 or streptavidin for IRAK-4 (10 mg/mL in PBS, overnight at 4 °C). The coating solution was removed and in 80  $\mu\text{L}$ /well a kinase reaction mixture was added (for IRAK-1: 20 mM Tris-HCl, pH 7.5, 10 mM  $\text{MgCl}_2$ , 2 mM EGTA, 1 mM NaF, 0.5

mM benzamidine, 1 mM DTT, 3  $\mu$ M ATP, 1mM of biotinylated substrate peptide bio-ARFSRFAGSSPSQSSMVAR, sequence derived from IRAK-1; for IRAK-4: 20 mM Tris-HCl, pH 7.5, 10 mM  $MgCl_2$ , 2 mM EGTA, 1 mM NaF, 0.5 mM benzamidine, 1 mM DTT, 10% glycerol, 10  $\mu$ M ATP, 1mM of biotinylated substrate peptide bio-RRRVTSPARRS, sequence derived from GFAP).

At 10  $\mu$ L/well in DMSO test compounds were added covering a final concentration range from 1nM to 30mM. Recombinant, full-length IRAK-1 or IRAK-4 enzyme (baculovirus expression system) was added in 10  $\mu$ L buffer containing Tris-HCl pH 7.5 20 mM, EGTA 2 mM, benzamidine 0.5 mM, DTT 1 mM,  $MgCl_2$  10 mM and glycerol 10% (IRAK-4 only) to initiate the kinase reaction. The reaction mixture was incubated at room temperature for 60 min on a shaker. During this incubation the substrate peptide is being phosphorylated by the kinase and gets captured onto the surface of the wells by neutravidin or streptavidin, respectively. The plate was washed 3x with 150  $\mu$ L distilled water to terminate the reaction and remove components of the reaction mixture. A conventional chemiluminescent ELISA detection technique was initiated by adding 100  $\mu$ L/well primary antibody (monoclonal antibody YC10, generated to recognize the phosphorylated epitope in the substrate peptide; used at 1:20,000 dilution for IRAK-1 and 1:10,000 dilution for IRAK-4) premixed with horseradish peroxidase (HRP) conjugated anti-mouse secondary antibody (commercially available from several sources; used at 1:10,000 dilution) in PBS containing 2% BSA. The solution was incubated at room temperature for 40 min on a shaker, then washed 3x with 150  $\mu$ L of water. 100  $\mu$ L/well 10x diluted SuperSignal HRP substrate (from Pierce) was added and after 5 min incubation the chemiluminescent signal was captured by a Labsystems LuminoSkan luminometer. The point of 50% inhibition of IRAK-1 or IRAK-4 enzyme activity ( $IC_{50}$ ) was determined (see Table 1).

**INTERNATIONAL SEARCH REPORT**

PCT/US 02/32437

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 66-78 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☒ Claims Nos.: 41,42  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 41,42

Present claims 1-61, 63-78 relate to products defined by reference to a desirable characteristic or property, namely that they are prodrugs.

The claims cover all possible compounds which may be prodrugs of the compounds (I) whereas the application provides support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT for only a very limited number of such prodrugs ("esters" on page 13). It is fully unclear where these "esters" belong on the molecule. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Independent of the above reasoning, the claims also lack clarity (Article 6 PCT). An attempt is made to define the products by reference to a result to be achieved. Again, this lack of clarity in the present case is such as to render a meaningful search over the whole of the claimed scope impossible. Consequently, the search has not been carried out for prodrugs.

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claim(s) may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons, a meaningful search over the whole breadth of the claim(s) is impossible. Consequently, the search has additionally been restricted to the first claim for which a limitation lead to a clear distinction from the prior art i.e. claim 21. Additionally the current claims relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the combination of claim 21 with Y as C(O) and R is not alkyl. It should be noted that this covers all of the claimed examples and every example apart from example 19.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
